Compact! Convenient! Colorful! Take It Anywhere!

When we couldn't find the ideal portable star atlas, we decided to create it ourselves.

This handy map book features 80 charts showing stars to magnitude 7.6 and 1,500 color-coded deep-sky wonders, including all the Messier, Caldwell, and Herschel 400 objects. Constellations are delineated with the same stick figures used in *Sky & Telescope* and *Night Sky*. Facing pages show contiguous areas, and indicators in the margins point to adjacent charts. Special close-up maps highlight the Orion Nebula, the Pleiades, the Virgo Galaxy Cluster, and the Large Magellanic Cloud.

Packing plenty of detail without sacrificing legibility, this is the atlas you'll always want with you at the telescope. It's perfect for binocular stargazers too! *110 pages, 6 by 9 inches, spiralbound with paper spine, softcover.*

Sky & Telescope's Pocket Sky Atlas by Roger W. Sinnott
